Project Report:

Critical Thinking Assignment 1 – Basic Calculator

This documentation is part of the Critical Thinking Assignment 1 from CSC500: Principles of Programming at Colorado State University Global. This Project Report is an overview of the program's functionality and testing scenarios, including console output screenshots. The program is coded in Python 3.12, and it is called Critical Thinking Assignment 1 – Basic Calculator.

The Assignment Direction:

Creating Python Programs

Part 1:

Write a Python program to find the addition and subtraction of two numbers.

Ask the user to input two numbers (num1 and num2). Given those two numbers, add them together to find the output. Also, subtract the two numbers to find the output.

Part 2:

Write a Python program to find the multiplication and division of two numbers.

Ask the user to input two numbers (num1 and num2). Given those two numbers, multiply them together to find the output. Also, divide num1/num2 to find the output.

Compile and submit your pseudocode, source code, and screenshots of the application executing the code from parts 1 and 2, the results, and GIT repository in a single document (Word is preferred).

Note: Refer to the Module 1 Overview for resources and help using GIT.

My Program Description:

The program is a simple calculator consisting of two parts.

Part 1 (addition/subtraction) and Part 2 (multiplication/division).

It uses basic input validation, formats console output using box-drawing characters, and implements a menu.

Git Repository:

I use [GitHub](#) as my Distributed Version Control System (DVCS).

The following is a link to my GitHub profile, [Omega.py](#).

The link to this specific assignment is: z

Figure-1
Code on GitHub

The screenshot shows a GitHub repository interface. The top navigation bar includes links for Code, Issues, Pull requests, Actions, Projects, Wiki, Security, Insights, and Settings. The main area displays the repository 'Principles-of-Programming-CSC500 / Critical-Thinking-1' with a commit message from 'Omegapy' adding the project. The code editor shows the 'basic_calculator.py' file, which contains a detailed Python script for a basic calculator assignment. The code is well-commented, explaining the purpose of each part: Part 1 (addition and subtraction), Part 2 (multiplication and division), module functionality, dependencies, usage/integration, and Apache-2.0 licensing. The file also includes sections for constants, functions, imports, global variables, and application headers. The GitHub interface includes a search bar, a file tree on the left, and a status bar at the bottom indicating the file was last modified on 9/9/2025 at 9:23 AM.
